

Developer Needed — Personalised Action Plan Generator / PDF System

Project Overview

We are building a new New Zealand ageing-navigation service called [Ageing Navigator](#).

Families complete an online questionnaire about an older person's current situation, support needs, risks, funding, legal planning, future care options and other relevant areas.

From this information, we want to generate a personalised **Family Action Plan** that clearly shows:

- The family's current situation
- Key priorities
- What actions should happen next
- Suggested timing
- Who may need to be involved
- Relevant information and resources
- Suitable service/provider options where appropriate
- A practical action checklist
- A short summary that can be shared with professionals

We are looking for a developer to build the **first version of the Action Plan generation system**.

This is not simply a static PDF template.

The Action Plan needs to exist as structured data that can later be reopened, updated and used for implementation support.

What We Need Built

The basic workflow should be:

Questionnaire data

↓

Structured Family Profile

↓

Structured Action Plan

↓

Reusable document template

↓

Professional PDF Action Plan

We will initially test the system using dummy/fictitious family data.

AI, decision logic and our full information repository will be developed separately, so the first stage should focus on creating a strong foundation that these systems can connect to later.

1. Structured Family Profile

We need a data structure that can store information such as:

- Person's name and age
- Living situation
- Current support
- Mobility
- Health-related concerns
- Memory/cognitive concerns
- Family support
- Recent hospital events
- Home safety
- Funding/assessment status
- Legal/EPOA status
- Transport
- Social connection
- Respite needs
- Future living preferences
- Residential care considerations
- Retirement village considerations
- Other relevant information

The structure should be flexible so additional fields can be added later.

JSON or a similar structured format is likely appropriate.

We are open to your recommendation.

2. Structured Action Plan

The Action Plan should NOT exist only inside the PDF.

Each recommendation/action should be stored separately so it can later be updated.

For example:

- Action title
- Description
- Priority
- Suggested timing

- Person responsible
- Status
- Related category/module
- Source
- Notes
- Date created
- Date updated

Possible action statuses could include:

- Not started
- In progress
- Waiting on third party
- Completed
- No longer required

The system should be designed so that an Action Plan can eventually become a **living plan**, rather than a one-off document.

3. Action Plan Modules

The system should support conditional modules.

Examples include:

- Staying safely at home
- Home care and support
- Falls and mobility
- Government funding
- Needs assessments
- Dementia/cognitive changes
- Hospital discharge
- Respite
- Family carer support
- EPOA/legal planning
- Financial considerations
- Transport
- Social connection
- Retirement villages
- Residential care
- Equipment/home modifications
- Emergency planning
- Future planning

If a module is not relevant to the family, it should not appear in their Action Plan.

We need to be able to add new modules in future without rebuilding the entire system.

4. Standard Module Format

Each module should support fields such as:

What we noticed

Personalised summary based on the family's information.

Why this matters

Short explanation.

What to do next

Practical actions.

Who may be able to help

Relevant organisation or professional type.

Questions worth asking

Useful questions for GPs, hospitals, assessors, solicitors, care providers etc.

Useful information

Relevant information retrieved from our future knowledge repository.

Sources

Where the information came from.

Not every module will need every field.

5. Priority System

We want the plan to clearly show the family's priorities.

For example:

- **Now / High Priority**
- **Soon / Medium Priority**
- **Plan Ahead**

The design should make it very easy for a family to understand what they need to focus on first.

6. Provider / Service Matching

In future, the system may provide suitable service or provider options based on family criteria.

For example:

- Retirement villages
- Home care providers
- Residential care facilities
- Community organisations
- Legal services
- Equipment providers

We do NOT want the system built around subjective "recommended providers".

It should support **transparent matching/options**.

For example:

This option is shown because it matches:

- Requested location
- Required care level
- Budget criteria
- Dementia support requirement
- Availability
- Other relevant criteria

The system architecture should be able to support this in future.

The provider repository itself is not part of this initial job.

7. PDF Action Plan Generator

We need a professional, consistent document generated from the structured Action Plan data.

Preferred approach:

Structured data → HTML/CSS template → PDF

We are open to your preferred technology.

Possible tools may include:

- Puppeteer
- Playwright
- Headless Chrome
- Similar HTML-to-PDF solution

The PDF must:

- Have a consistent design
- Handle short and long content
- Handle automatic page breaks
- Avoid text overflowing

- Remove irrelevant sections
- Work with variable numbers of priorities/actions
- Look professional when printed or viewed digitally
- Be easy to update visually later

We do NOT want the production system based on manually editing Canva documents or inserting text into fixed PDF fields.

8. Action Plan PDF Structure

The document will likely include:

Cover

- Ageing Navigator branding
- Family/person name
- Prepared for
- Date
- Plan version

Your Plan at a Glance

A simple overview of:

- Key priorities
- What needs attention
- Recommended next step

Your Top Priorities

Approximately 3–5 important priorities.

What You Told Us

A summary of the person's current situation.

Recommended Next Steps

An action table showing:

- Priority
- Action
- Responsibility
- Timing

Relevant Action Plan Modules

Only modules relevant to the person's circumstances.

Action Checklist

A consolidated checklist of the actions contained in the plan.

Implementation Support

A short section explaining that Ageing Navigator can assist families with carrying out the actions in the plan.

Sources / Important Information

- Sources used
 - Date information was reviewed
 - Plan version
 - Disclaimer
-

9. Professional Summary

We also want the ability to generate a separate **1–2 page Professional Summary** from the same information.

This may later be shared with:

- GPs
- Hospitals
- Social workers
- Needs assessors
- Allied health professionals
- Care providers
- Other professionals

It should summarise items such as:

- Current living situation
- Existing support
- Mobility
- Recent significant events
- Main concerns
- Family goals
- Current services
- Existing assessments
- EPOA status
- Main priorities
- Actions already underway

No duplicate data entry should be required.

10. Versioning and Updates

Each Action Plan should support:

- Unique Plan ID
- Date created
- Last updated date
- Version number

For example:

Version 1.0 — 22 September 2026

If circumstances change, we need the ability to update the structured Action Plan and regenerate the document.

We do not want families to have to start from scratch each time.

11. Simple Admin / Testing Interface

For the proof of concept, we would like a simple internal interface where we can:

1. Paste or upload structured test data
2. Preview the Action Plan
3. Generate the PDF
4. Change the data
5. Regenerate the document

We do not need a sophisticated dashboard at this stage.

A simple secure admin/testing interface is sufficient.

12. Dummy Test Cases

We expect to test the system using several fictional family scenarios.

Examples may include:

- Older person living alone with recent falls
- Person with dementia and an exhausted spouse
- Hospital discharge situation
- Healthy couple planning ahead
- Family considering residential care
- Family concerned about funding/affordability

We need a simple way to load these test cases and generate different plans.

13. Future Integration

The system should be designed so it can later connect to:

- Online questionnaire
- CRM/database
- AI analysis
- Decision engine
- Knowledge repository
- Provider/service repository
- Family dashboard
- Navigator dashboard
- Automated follow-ups
- Email/SMS reminders
- Paid implementation support
- Ongoing/subscription support

These features are NOT part of this initial project.

However, we do not want the Action Plan architecture to prevent these integrations later.

Scope of This Initial Project

The initial project should focus on:

1. Recommended technical architecture
 2. Family Profile data structure/schema
 3. Action Plan data structure/schema
 4. Modular/conditional Action Plan system
 5. Reusable HTML/CSS document template
 6. PDF generation
 7. Professional Summary generation
 8. Simple internal test/preview interface
 9. Support for document updates/versioning
 10. Technical documentation for future integration
-

Not Required at This Stage

You do NOT need to build:

- The full family questionnaire
- AI recommendation engine
- Full decision logic
- Full knowledge repository
- Provider repository
- Customer portal
- Navigator portal

- Payment system
- Subscription system
- CRM
- Automated email/SMS workflows

These will be separate stages.

Security

The eventual system will contain personal family information.

Please consider privacy and security from the start.

Requirements should include:

- Protected admin access
- No publicly accessible family information
- Secure file/document storage
- No unnecessary personal data in logs
- Secure document links
- Appropriate handling of temporary files

We will use fictional information during the initial testing stage.

Deliverables

At completion, we should be able to:

1. Create a fictional family profile in structured data.
 2. Create their structured Action Plan.
 3. Include only relevant modules.
 4. Add multiple actions with priorities and statuses.
 5. Generate a professional Action Plan PDF.
 6. Generate a separate Professional Summary.
 7. Change the family's information.
 8. Update their Action Plan.
 9. Generate a new version without redesigning the document.
 10. Add new Action Plan modules later.
 11. Connect the system to our questionnaire/AI/repository in future.
-

Skills We Are Looking For

Strong experience with some combination of:

- Full-stack web development

- Structured data / JSON schemas
- HTML/CSS
- Dynamic document generation
- HTML-to-PDF generation
- Puppeteer / Playwright or similar
- Database design
- API-ready architecture
- Secure web applications

Experience with AI applications, workflow automation or structured AI outputs would be useful, but this is not primarily an AI development role at this stage.

Ideal Freelancer

We are looking for someone who:

- Thinks about architecture, not just coding
- Can recommend the simplest scalable solution
- Understands the difference between structured data and document presentation
- Can create clean, professional document layouts
- Builds systems that can be expanded later
- Communicates clearly
- Can challenge our proposed approach where there is a better technical solution

We prefer a practical MVP approach rather than over-engineering the first version.

When Applying

Please include:

1. Examples of any dynamic PDF/document-generation systems you have built.
2. Your recommended technology stack for this project.
3. How you would structure the Action Plan data separately from the PDF itself.
4. How you would handle conditional sections and variable-length content.
5. How you would design the system so plans can be updated later.
6. Whether you have experience integrating structured AI output into software systems.
7. Your estimated approach/stages for completing the MVP.

Please start your application with the words:

ACTION PLAN

so we know you have read the full brief.

Important

Before development starts, we would like the selected freelancer to first provide a proposed architecture and data/schema design for approval.

The objective is to build a **strong foundation for a living Action Plan system**, not simply a one-off PDF generator.
